

Title: Call Ambulance for Hospital Management System

As a hospital staff member, I want the ability to call an ambulance directly from the Hospital Management System, so that we can quickly and efficiently respond to emergency situations and provide timely medical assistance to patients in need.

Acceptance Criteria:

1. Initiating the Ambulance Request:

The system should provide a clear and user-friendly interface for initiating an ambulance request.

2. Patient Information Input:

When initiating the ambulance request, the system should prompt the user to enter essential information about the patient and a brief description of the medical emergency.

3. Emergency Contacts and Notifications:

The system should allow users to specify emergency contacts who will be notified automatically when an ambulance is requested.

4. Cancellation Feature:

The system should provide a confirmation prompt to avoid accidental cancellations.

5. Logging and Reporting:

The Hospital Management System should maintain a log of all ambulance requests, including details such as the date, time, patient information, and the ambulance assigned.

Success:

1. The patient will be redirected to ambulance request page, if he/she provides information successfully.
2. After successful ambulance request, the ambulance will be allocated for specific patient
3. If the request is cancelled successfully, the ambulance call will be immediately terminated.
4. After successful check in the hospital, ambulance will be reported.

Failure:

1. If there is an issue in providing information, try again after some time.
2. If the ambulance request is not initiated, then troubleshoot and fix it.
3. If there is an error cancelling ambulance, the error message will appear to user.
